

### Intuitive graphical interface

Consumption and usage data is available in a variety of intuitive on-screen graphical formats.

### Detailed printouts

Detailed Crystal Reports are available on screen or as hard copy printouts.

### MPG or L/100km

Information can be displayed in MPG or L/100km depending on your preference.

### Fuel & Oil

Consumption data per asset is available for any number of defined items. This could include for example 'Diesel', 'Red Diesel', 'Oil'.

### Data checking Fault Prediction

Errors and inconsistencies are highlighted in red and can be easily corrected on-screen with the benefit of all known related fuel information.

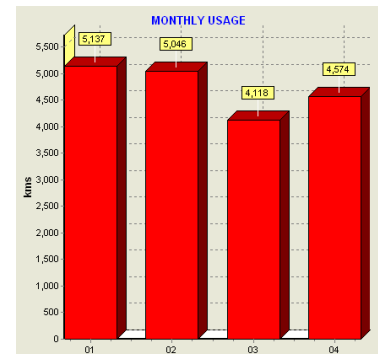

### Fuel Merging using intuitive excel import

Most Freeway users have multiple sources of fuel, including fuel cards and a fuel monitoring system for on site fuel tanks. Freeway's excel import merges all these data sources so that a vehicle's fuel consumption and usage pattern can be analysed based on a single consolidated set of information.

Structure of Fuel File

Fuel File (xls) :

	A	B
1		
2		
3		

### Identify the Rogue Vehicles

Most Freeway customers have mixed fleets operating in complex business environments. Within these environments Freeway can pick out rogue vehicles within each user-defined peer group of vehicles. For example, Freeway can identify poor performance within a particular tonnage of vehicle operating a specific route.

### Drill Down to Fill by Fill level

Once Freeway has identified sections of the fleet that are performing poorly it is possible to 'drill down' to the individual vehicle's performance, and then to a fill-by-fill consumption analysis.
