

Freeway software - The intelligent early warning system

If you suspect that vehicles are not running efficiently, how can you be certain? If running costs seem high, how can you check them? And how long will that take you? Even a small fleet can generate a mountain of paperwork, which can hide the specific information you need to run an efficient and cost effective operation. The answer is FREEWAY, the intelligent fleet management software system. Problem areas are highlighted immediately on screen or in the form of written reports. Exceptions are reported against average or budget. No matter what the size or complexity of your fleet you get the right information and full control.

Reduce costs; Improve efficiency

FREEWAY starts by drawing your attention to key problem areas, such as a particular category of vehicles or a site. FREEWAY then identifies the areas of high cost, which could range from fuel or tyres to repairs and maintenance. Performance can be judged against average or budget. Then, direct causes of inefficiency are pinpointed; for example, unusually high expenditure on brakes, allowing you to take immediate and fully informed action.

Whether you require an overview of fleet performance or details on a problem area, FREEWAY provides the answers in seconds.

And FREEWAY is designed to give you meaningful answers, whether your fleet includes HGVs, tankers, coaches, pool cars, trailers or any other type of vehicle; and you can manage plant items such as pumps. Air conditioning and generators.
